

NPLCC Science and TEK Subcommittee Meeting

Feb 29, 2012

NPLCC has a *decision support* function

- The North Pacific Landscape Conservation Cooperative promotes development, coordination and dissemination of science to **inform** landscape level **conservation and sustainable resource management** in the face of a changing climate and related stressors.
- LCCs are “management-science partnerships that **inform** integrated **resource-management actions** addressing climate change and other stressors across landscapes”

What is needed for effective decision support?

Goal of a decision support program should be “to provide knowledge that people need to make better decisions and to do so in ways that enable and empower decision makers to use it appropriately.”

- Six principles
(2009 National Academies report)
 1. Begin with user's needs
 2. Give priority to processes over products
 3. Link information producers and users
 4. Build connections across disciplines and organizations
 5. Seek institutional stability
 6. Design for learning

Begin with user's needs...

- **Effective and useful decision support must start with a clear understanding of the decisions that are to be supported**
- **NPLCC Steering Committee addressed some of these questions in a Framing Workshop in October, identifying**
 - Type of decisions the NPLCC aims to support (and examples of the kinds of decision-makers involved)
 - Outcomes likely to be of interest to resource managers as they make those decisions.

Two types of LCC-relevant decisions

● Decisions supported by the LCC

Natural resource management decisions and conservation delivery efforts that the LCC is intended to inform and support

Examples:

- Land acquisition of sensitive areas
- Species recovery plans

Ellsworth Creek Preserve
Restoring a Low Elevation Coastal Rainforest in Southwest Washington

Ellsworth Creek is a small coastal watershed comprised of coniferous forests, a freshwater stream system, and large estuary. The watershed is located within the Sitka spruce forest zone and contains several small patches of old-growth forest. These remnants are some of the largest remaining old growth forest stands left within the Willapa Bay region of southwest Washington and contain five distinct natural forest community types. The Conservancy acquired the Ellsworth Creek Preserve to conserve and restore a highly productive and biologically diverse coastal temperate forest ecosystem in an area of the Pacific Northwest Coast that has been managed almost exclusively for timber production. Our science is helping advance forest restoration throughout the Pacific Northwest coast.

Two types of LCC-relevant decisions

● Decisions that the NPLCC itself makes

how to organize, how best to define and meet the NPLCC mission, where to focus efforts and resources, what applied science to support in what time frames, and so on.

Examples:

- Selection of activities
- Boundaries and internal organization

Project Funding Now Available from the North Pacific Landscape Conservation Cooperative

The North Pacific Landscape Conservation Cooperative has announced the availability of funds to support climate and landscape science projects. Find out more about this opportunity by clicking on either link shown below:

Climate Change Effects on Marine and Coastal Ecosystems in the North Pacific LCC

The U.S. Fish and Wildlife Service commissioned a report for southeast Alaska, British Columbia, northern California, Oregon and Washington that provides the latest science and information on expected impacts of climate change on marine resources - The Climate Change Effects on Marine and Coastal Ecosystems in the North Pacific LCC

Workshop Held on Modeling for Estuaries, Climate Change, Restoration, and Conservation Planning

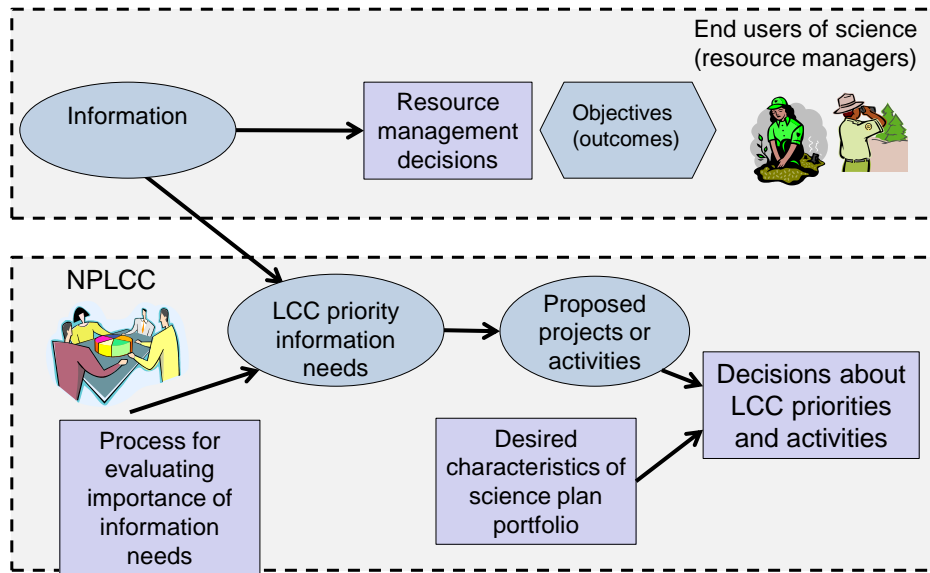

Sea Level Rise and its effects on Pacific Coast estuaries was the topic of a workshop held in Newport Oregon in February 2011, organized by the U.S. Fish and Wildlife Service's Redfish Division and Coastal Program, the State of Oregon's Oregon Coastal Management Program, U.S. Geological Survey, and the Environmental Protection Agency. The goal of the workshop was to discuss the latest sea level rise information in order to improve understanding between researchers and managers working to incorporate the latest climate change science into estuary restoration and planning.

Process & Framing Workshop

7

How do we use this framing going forward?

- **As you develop science and information priorities for the NPLCC, it is important to ask yourselves:**
 - What partner or customer(s) needs or can use this information (or data, or product)?
 - What conservation and sustainable resource management decisions will the information help support?
 - Will the data or product provide useful information about an outcome of interest to those partners or customers?

8

Science Planning Processes

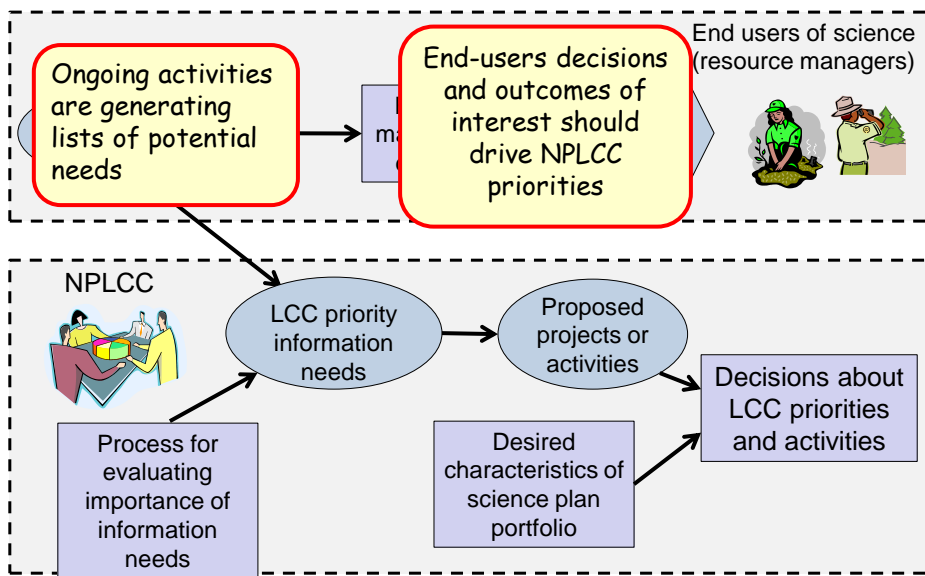

Motivating questions

- **What are the important information gaps to address?**
- **What are the best approaches for addressing those information gaps?**
- **What mix of research, over what time period, will be most useful to NPLCC partners?**

Five steps to developing a science plan

- **Identify potential science/information needs**
 - “Science needs” are unknowns or uncertainties which affect the ability to meet societal goals
- **Identify information gaps to address?**
 - Information being collected by others:
- **Prioritize science/information needs**
 - Prioritized needs can be used to target future projects and/or RFPs
- **Develop & evaluate projects**
 - What are the best approaches for addressing those gaps?
- **Establish and incorporate portfolio-level considerations for creating the desired mix of projects**
 - What mix of research is most useful?

Conceptual Process for Science Planning

Key concepts for each step

- **Identification of needs should be driven by the management questions facing NPLCC partners**
- **Prioritize needs based on potential information value**
 - Derives from the ability to use that information to improve management decisions
- **Project evaluation can and should be separate from the “priority” of the question being addressed**
- **Strong portfolio requires consideration of factors in addition individual project value**

BA Services Applications

13

Clear separation of the steps...

- **Allows for (requires) broad participation in the identification of potential information needs**
- **Can help identify current information-sharing opportunities**
- **Leads to identification of science priorities before project solicitation and evaluation**
 - Let the management questions drive the science priorities
- **Leads to a better targeted work and, possibly, a better targeted RFP**
 - With the projects solicited to address priorities, rather than priorities derived from proposals
- **Allows projects to be evaluated using traditional scientific review process, if desired**
- **Explicit “overlay” of science plan objectives separate from the technical merit of proposals**

BA Services Applications

14

Approaches for identifying (possible) information needs

- **Three approaches explored in October Framing workshop**
 - Biogeophysical models, including extraction of common themes
 - Decision-focused conceptual models to identify critical uncertainties
 - Brain-stormed list of information needs
- **Several additional approaches will be described this morning**
- **Other approaches being used**
 - Large LCC-wide Science Workshop (e.g., W. Alaska LCC)
 - Survey or compile a list from partner agencies (e.g., Appalachian LCC, Pacific Islands CCC)

To provide effective decision support, it is critical that information “needs” be connected to decisions and to outcomes of interest

Approaches for prioritizing information needs

- **Formal Value of Information (VOI) analysis**
 - The “gold standard” for valuing information collection opportunities and options for well-defined decisions
- **Sensitivity analysis**
 - Useful for understanding how changes in key variables translate to changes in outcomes of interest
- **Multi-attribute utility analysis (MUA)**
 - A tool for comparing options (in this case information collection opportunities) using multiple criteria simultaneously
- **Non-analytical approaches**
 - E.g., surveys, polling, voting, etc.

Approaches for evaluating and selecting projects

- **Standard approach**

- Define and include a set of project evaluation criteria in an RFP (or clearly specify a desired product and seek a researcher who can deliver that product)
- Committee of evaluators judge how well each project meets the criteria
 - *Can be done informally or formally*
- Top ranked project(s) selected

- **Issues to consider**

- Often try to include too much in the set of evaluation criteria
- Useful to separate the importance of the underlying problem being addressed from the quality of the proposed work itself

Approaches for portfolio construction and analysis

- **Rank projects and fund “from the top down”**

- **Multi-attribute**

- **Portfolio simulation**

- Often with Portfolio Optimization

- **Modern portfolio theory**

- Efficient frontiers

Main complication is that the decision-maker almost always has objectives that relate to portfolio “balance”

Often try to do too much within project evaluation!

- **Some project evaluation criteria used by various LCCs**

- Whether they address specifically identified topics
- Specific type of information
- Breadth of project; multi-disciplinary
- Decision relevance
- Climate relevance / relevance to landscape-level stressors
- Time scale of project
- Time scale of issues addressed
- Connection to FWS and other Partner Missions
- Partnerships/leveraging
- Relationship to other ongoing work / value added
- Geographic scope
- Multiple / cross- taxa focus
- Scientific / professional merit
- Programmatic capability
- Inclusion of education / outreach components
- Project management & evaluation plan
- Budget

19

Example criteria – information needs

- **Considerations in evaluating the priority or importance of addressing an identified information need**

- Decision-relevance of the information
- Breadth or range of decisions the information could support
- Urgency / timing of information needs relative to decision needs
- Opportunity for information collection & uncertainty reduction exists now that will not exist later.
- Criticality of LCC-level participation (e.g., is not currently be addressed by anyone else)

20

Example criteria – project evaluation

- **Considerations in evaluating a proposal or a proposed provider of needed information**
 - Responsiveness to the scope of the request
 - Scientific merit / soundness of the study proposal
 - Qualifications of the team / programmatic capability
 - Timeliness of study results
 - Adequacy of plan for sharing and communicating study results to interested partners and stakeholders

Example portfolio considerations

- Support/promote work in different geographic and ecologic areas within the LCC
- Address multiple taxa
- Include both “quick wins” and longer term projects
- Include projects which have high probability of success and some that are higher risk
- Include projects that address each (or some subset) of identified “priority” information needs
- Etc...

Example criteria for each evaluation step

Priority/importance of information need	Project evaluation	Portfolio considerations
<ul style="list-style-type: none"> Decision-relevance of the information Breadth or range of decisions the information could support Urgency / timing of information needs relative to decision needs Opportunity for information collection & uncertainty reduction exists now that will not exist later. Criticality of LCC-level participation (e.g., is not currently be addressed by anyone else) 	<ul style="list-style-type: none"> Responsiveness to the scope of the request Scientific merit / soundness of the study proposal Qualifications of the team / programmatic capability Timeliness of study results Adequacy of plan for sharing and communicating study results to interested partners and stakeholders 	<ul style="list-style-type: none"> Support/promote work in different geographic and ecologic areas within the LCC Address multiple taxa Include both "quick wins" and longer term projects Include projects which have high probability of success and some that are higher risk Include projects that address each (or some subset) of identified "priority" information needs Etc...

S/TEK challenges – Science Strategy

- **Comprehensive set of potential information needs**
 - Include perspectives of all NPLCC partners
 - Focus on *unmet* needs
- **Clearly define prioritization criteria (for information needs)**
- **Develop and incorporate and portfolio-level considerations in strategy development**
- **Balance need for transparency and defensibility with time and effort required to analyze & prioritize**

S/TEK challenges – FY12 priorities

- **Relatively small amount of resources available and priorities must be established quickly**
- **Balance efforts between:**
 - Identifying potential information needs and FY12 activities
 - Prioritizing those needs/activities
- **Use FY12 prioritization to initiate & test criteria and approach for longer-term strategy development**
